

LIMITLESS HOOPS BOOKING SYSTEM 2.0 - BUSINESS LOGIC & FRONTEND VIEWS

1. USER ACCOUNTS & ROLES

Accounts are absolutely necessary to solve the current pain points. We need distinct experiences for different types of users:

- **Customers (Parents/Players):**
 - Need multiple login options (Email, Google, Apple, Facebook).
 - **The "Household" Concept:** One account needs to manage multiple players (kids), and multiple adults (split households) need to be able to manage the same player.
 - Must be able to manage their own memberships (pause, resume, cancel) without going to a third-party site.
- **Coaches:**
 - Need to view class rosters easily from their phones.
 - Need to receive specific alerts for only the classes they are assigned to.
- **Admins:**
 - Need full control over mass event creation, venue management (uncapped, >20), global reporting, and refunds.

2. MEMBERSHIPS, PRICING & PAYMENTS

The payment system needs to be brought in-house to reduce friction.

- **Tiers & Strict Contracts:** Support for 2-month, 4-month, and 1-year commitments (Volunteer, Recreation, Seasonal, Limitless). See `membershipTiers.md` for the strict "Club Dues" billing logic, grace periods, and cancellation rules.
- **Dynamic Pricing:** The system must recognize the user's tier and apply the correct price (sometimes free) to an event.
- **Integrated Checkout:** Payments happen directly on the site via Stripe.
- **Cart System (High Priority):** Customers must be able to select multiple dates/events, add them to a cart, and check out all at once.
- **Billing Transparency:** Automated heads-up emails before recurring charges happen. Centralized view for admins to see all recurring payments.
- **Upgrades & Credits:** Ability to calculate mid-contract upgrades ($\text{New Tier} - \text{Amount Paid} = \text{Balance Owed}$) and apply promo codes.

3. THE BOOKING & EVENT ENGINE

Events are complex and need flexible rules.

- **Event Types:** Recurring events, one-time events, and "TBD" events (where time/location are genuinely to be determined, not faked).
- **Visibility & Caps:** Control when an event becomes visible, when booking closes, and the maximum capacity (triggering a waitlist).

- **Extras:** Ability to upsell add-ons (carpools, hotels, gear) at checkout for specific events.
 - **Flexibility:** Admins must be able to edit a schedule/series even if a single event in that series is already booked. Customers must be able to cancel a single instance of a recurring booking without canceling the whole series.
-

PROPOSED FRONTEND VIEWS (INITIAL DRAFT)

To build this frontend-first, here are the primary screens/views we should define:

Customer Views

1. **Public Event Discovery:** Filterable calendar/list view of upcoming events (Main vs. Special events). Embeddable on the marketing site.
2. **Event Detail / Booking:** Shows event info, pricing (based on user state), and limited public roster (who's going).
3. **Shopping Cart & Checkout:** The new multi-date checkout experience with integrated payment, promo codes, and up-sells (extras).
4. **Customer Dashboard:**
 - **Household Hub:** Manage linked adults and children.
 - **Schedule:** Upcoming bookings with iCal sync and options to cancel specific dates.
 - **Membership & Billing:** View tier, pause/cancel membership, view past invoices, and manage payment methods.

Coach Views

1. **Coach Dashboard (Mobile-First):** Shows their assigned schedule.
2. **Mobile Roster:** View attendees, emergency contacts, and waitlist for a specific class.

Admin Views

1. **Global Dashboard:** High-level metrics, upcoming payments, and quick actions.
2. **Mass Event Builder:** The interface for generating months of events at once, managing blackouts/exceptions, and assigning coaches.
3. **Venue Management:** Add and manage unlimited locations.
4. **Financial Hub:** View all recurring payments, issue refunds directly, and generate monthly printable reports.
5. **Communications Center:** Send targeted SMS/Email to specific event rosters.
